Student/team name:

		Rubric	Weighting	8-10-Excellent	5-7- Good	4 - Satisfactory	0-3 – Poor or Needs Improvement
1	Text Extraction	**OCR Accuracy**	10	Accurately extracts text from a wide variety of image types (e.g., scanned documents, photos) with high precision and minimal errors.	Extracts most text accurately; minor issues with complex or low-quality images.	Frequent inaccuracies; struggles with complex layouts or noisy images.	Fails to extract meaningful text; highly error-prone.
2		**Text Preprocessing (Tokenisation, Stemming, Lemmatization, Stopword Removal)**	10	All preprocessing steps are implemented effectively and adaptively, improving downstream tasks.	Most steps are implemented correctly; minor issues in stemming/lemmatisation.	Incomplete or inconsistent processing; some steps missing or ineffective.	Lacks meaningful preprocessing; outputs noisy or unrefined data.
		Feature Recognition (TF-IDF/BoW, key phrase extraction, NER, and optional sentiment analysis)	10	Accurately identifies key phrases, patterns, and document sections; Uses a range of appropriate and modern NLP techniques, with clear justification and strong performance.	Generally identifies important elements, though misses occasional nuances. Applies standard NLP techniques correctly, with some attempt at richer analysis.	Limited identification; misses many key phrases or mislabels sections. Shows basic attempt at feature extraction, but with limited depth or effectiveness.	Fails to detect meaningful patterns or textual features. Feature extraction is missing, incorrect, or ineffective.
4		**Text Analysis(categorises sections, extracts tables, and identifies text-image relationships)**	10	Demonstrates a strong understanding of document structure and relationships within the text. Accurately identifies and labels document sections, correctly detects tables, identifies relationships within the document	Shows reasonable ability to interpret structure, but with some inconsistencies. Identifies major sections, Detects tables, limited handling of relationships	Provides basic structure recognition, but lacks consistency or depth.Some attempt to separate sections, but with errors, Tables may be detected as text blocks rather than structured data	Fails to meaningfully interpret document structure. No clear separation of sections, Tables, figures, and text all treated the same
	Image Processing	**Image preprocessing (thresholding, denosing, etc)**	10	Applies a well-designed and adaptive preprocessing that significantly improves both visual quality and OCR performance. Uses a combination of techniques	Uses appropriate standard preprocessing techniques with moderate improvement. Applies common steps with some improvement of OCR performance.	Shows basic preprocessing, but with limited effectiveness. Uses minimal techniques with little improvement of OCR performance.	Preprocessing is ineffective, incorrect, or missing. No meaningful preprocessing applied, Incorrect use of techniques.
3		**Feature Detection (Identifies Tables, Signatures, Diagrams, Figures)**	10	Reliably detects and labels all major features/document layout elements with high accuracy across image types, even in complex documents. Correctly detects and localises key components and uses appropriate computer vision techniques.	Detects major layout elements reliably, but lacks precision or depth. Identifies main regions and uses standard techniques	Struggles with some features or inconsistent recognition. Provides basic or inconsistent detection of layout features. Detects some elements, but misses key regions	Fails to meaningfully detect or analyse document layout. Little to no detection of document elements. Incorrect or unusable outputs. No attempt to distinguish between text, tables, or images.
		Segmentation: segments images into regions	10	Demonstrates precise, meaningful segmentation of all relevant document regions with high consistency. Accurately segments, uses robust segmentation techniques and handles complex layouts.	Segmentation is **mostly correct**, but some errors or imprecisions exist. Detects the major regions reliably, may struggle with small or closely spaced elements or fine details in dense layouts.	Segmentation is incomplete or inconsistent. Only some elements are segmented; many regions are missed. Output is usable but requires significant post-processing.	Fails to segment meaningfully. Segmentation is missing, incorrect, or entirely ineffective.
	Multi-modal	**Text & Image Integration (Harmonious integration of textual and visual data)**	10	Demonstrates robust, precise, and meaningful integration between textual and visual components, reflecting a deep understanding of document structure. links text references to visual elements	Shows partial integration, linking some text to visual elements but lacking full depth or coverage. Major references are linked correctly.	Demonstrates minimal integration. Some attempt to connect text and visual elements	Fails to integrate text and visual content in any meaningful way.
		Final Output – Text and Image Results(Output includes cleaned text, key insights, segmented/annotated images)	10	Performs well across diverse document/image types and quality levels. Processed text is clean, structured, and comprehensive. Output is well-organized and easy to interpret, clearly separates raw, cleaned, and analysed text	Most text is processed correctly, Feature extraction and analysis capture key points but may miss nuances. Output is usable but not highly structured.	Text is partially processed: some cleaning or tokenization missing, limited feature extraction (e.g., only TF-IDF, no NER or key phrases). Output is basic, only marginally usable for analysis.	Minimal or no text processing applied, feature extraction missing or incorrect, Output is unstructured, unclear, or unusable
		Insights and Reporting (accurate section categorisation, pattern/key phrase detection, visualisation of insights)	10	Output is well-organised, comprehensive, and user-friendly; includes clear textual and visual insights, supports further analysis or decision-making	Output is mostly organised and interpretable, provides useful textual or visual insights, but may lack some detail or clarity. Provides moderate value for analysis.	Output is basic and partially organised.Limited insights, Some value, but requires interpretation or further processing.	Output is unclear, incomplete, or disorganised, little or no useful insight provided, Output does not support interpretation or analysis.
